

Hands-On Activity: Calibration Process Lab Using Robots –

On the Afternoon of Day 1

Calibration of algorithms and software will be practically experienced through the challenges of a group activity using robots. Participants will be grouped into teams of two to three people, given an overview of the robot and the task at hand. Given information on how to calibrate the robot, the teams will then develop their calibration, program a robot and run it.

To conclude this lab you will get a chance to run your programmed robot on the “official test track”. Each team will run a robot using their calibration to complete the track.
