9147 STANDARD
UNSLAVAGEABLE ITEMS MANAGEMENT - REQUIREMENTS FOR AVIATION, SPACE AND DEFENSE ORGANIZATIONS
9147 standard rationale and objectives

Need of an Aerospace standard to define unsalvageable items management including traceability, mutilation and reclassification.

One single document to propose a State-of-the-art process to cover the topic for any organization and its external providers

From raw material to aftermarket items

To support compliance with applicable regulations

To guarantee performance, reliability and safety of the final products, ensuring the final customers’ satisfaction
9147 standard potential benefits:

- Standardize unsalvageable management program requirements.

- Collect from aviation, space, and defense industry best practices and guidance.

- Increase product quality and safety.

- Achieve cost savings thanks to unsalvageable item reclassifications.

- Reduce waste / environmental footprint by fostering rework, repair, and reclassification.

- Protect companies’ intellectual property by preventing reverse engineering on the scrapped items.

- Encourage greater leadership engagement.

- Increase recognition by Regulatory Authorities and stakeholders.

- Address supply chain management more effectively.

- Allow IAQG members to use standards internally and with suppliers – One voice, minimize variation, share resources, reduce duplication and waste.
The IAQG is a legally incorporated international not for profit association (INPA) with membership from the Americas, Europe and the Asia Pacific Region (Rev. 08-2015)

- Members from the three IAQG sectors.
- Representatives from A/C and equipment manufacturers.
- Design, Production and maintenance organizations.

9147 writing team deliverables:

- IAQG Standard 9147
- Guidance material (SCMH, FAQ)

Based on:
- 16 Regulatory requirements part 21 and part 145 (FAA, EASA, CAAC, ...)
- IAQG 9100,9110, 9120 & SCMH
- Seven organizations best practices
9147 - Unsalvageable items mutilation example:
