The Paths of Soaring Flight

List of Chapters:

Foreword

Section A: The sailplane in still air
Chapter 1 Units, and Some Basic Ideas

Chapter 2 Wings and Winglets

Chapter 3 The Drag of a Sailplane
The total drag of a sailplane. Simple case of a parabolic drag polar: minimum drag and minimum power. Actual polars: effects of Reynolds number, ballast and altitude.

Chapter 4 The Equations of Motion

Section B: Instruments for soaring flight
Chapter 5 Instruments for Soaring Flight

Chapter 6 Other Instruments
Other instruments. The altimeter and its calibration. The airspeed indicator: pitot and static sources, pressure errors and their effect on limitations and best speeds to fly; calibration; other errors. Reduction of never-exceed speed with height to avoid flutter.

Section C: The sailplane in the atmosphere
Chapter 7 The Sailplane in the Atmosphere

Chapter 8 Flying in Thermals: the Classical Analysis
Chapter 9  Some Ideas on the Practice of Cross-Country Flying

Chapter 10  More Advanced Ideas on Cross-Country Flying
More advanced ideas on cross-country flying. Flight when the load factor is not unity. Computer calculations of sailplane performance. Use of water ballast and the effect of flying at the non-optimum weight.

Chapter 11  Optimisations in General

Chapter 12  The Effects of Wind

Chapter 13  The Effect of Centre of Gravity Position
Effect of CG position on performance. Loss of energy height at low and high speeds: overall loss of energy height.

Chapter 14  A Brief Note on Computers, Flight Data Recorders, GPS, etc.

Appendices
I. Some Useful General References
II. Conversion Factors
III. The Standard Atmosphere
