Index

Accelerating pump devices, 101
Aeromot Anemometric Tester, 46–47
Afterburners. See Thermal afterburners
Aircraft engines
- Junkers opposed-piston engine, 24
- Napier dual-scavenged engine, 4, 8
Air-fuel ratio
- air mass rate, 79
- calculation methods compared, 80
  vs. carbon monoxide, 99–101
- CO, specific emission of, 78–79
  derived expression for, 80
- HC specific emission, 78–79
- hydrocarbon oxidation, chemistry of,
  77–79
  of Piaggio FAST engine, 202
  vs. pollutant balance, 99
- scavenging process, effect of, 85–87
Autoignition
- characteristics of, 69
  Honda Paris-Dakar motorcycle engine, 76
  vs. misfiring, 69
  Piaggio VLB 1 M engine and tests, 71–75
  problems with positive engine shut-off, 76
  Semenov/Hinshelwood studies of, 69–70

Blair, Gordon
- single-cycle gas testing method, 49
Blowdown
- blowdown phase (in bench tests), 56
- blowdown process, 15, 16
- exhaust blowdown angle, 130–131
Bore/stroke ratio
- research cylinder geometry, 146
- scavenging/trapping efficiencies
  constant port area, 147
  similar geometries (50-cc, 500-cc), 149
  variable port area, 148
Carbon monoxide emissions
- vs. air-fuel ratio, 99–101
- CO conversion rate (cloth catalyst), 225
- effect of catalysts on (EFI), 188
  Ficht-PDS fuel injection system
  ICOMIA outboard engine tests, 181, 182
  Orbital Engine Company (OEC) system
  OCP exhaust emissions, 196
  SEFIS exhaust emissions, 197
  Piaggio direct-injection system
  direct-injected engine: CO emissions map, 175
  stock engine: CO emissions map, 174
  Piaggio FAST small-engine system
  CO emissions maps (FAST vs. standard), 201, 203
  ECE R47 emissions comparison
  (FAST vs. standard), 204
  ICOMIA emissions (FAST), 204–205
  ICOMIA emissions (standard), 205
  predicted vs. measured (scooter engines)
  50-cc base configuration (road load points), 250
Carbon monoxide emissions (continued) predicted vs. measured (scooter engines) (continued)

125-cc base configuration (road load points), 250
125-cc base configuration (WOT points), 249
200-cc base configuration (road load points), 248, 249
200-cc base configuration (WOT points), 247, 248

basic chemistry of, 246
factors affecting, 252
HC emissions, temperature corrections for, 251–252
and thermal afterburners
CO conversion fraction vs. temperature, 215–216
See also Catalysis/catalytic converters;
Hydrocarbon emissions; Nitrogen oxide emissions; Smog; Soot and particulates
Catalysis/catalytic converters
advantages of, 183
basic limitations of, 229
CO emissions: calculated vs. measured base configuration (WOT points), 247, 249
basic chemistry of, 246
improved scavenging (road load points), 249, 250
improved scavenging (WOT points), 248
exhaust gas temperature vs. catalysis, 245
materials/applications of
applications of (discussion), 222–223
catalytic substrates, typical properties of, 222
chainsaw engine, 223
CO conversion rate (fabric cloth), 225
fabric cloth muffler design, 224
HC conversion rate (fabric cloth), 226
hot tubes (Degussa), 227
legislative requirements, 222
metallic cartridge catalyst technology, 222
moped engine, 223
motorcycle engines, 223–224, 226–227
mufflers with precatalyst device/ clusters, 228
pellet catalysts, 221
temperature resistance of, 221–222
two-stroke vs. four-stroke engines, 221
oxygen stoichiometry, equations for, 253
and Piaggio direct injection system, 188
secondary air addition, enhancement by discussion of, 231, 233
reed valve device, 232
schematic layout of, 232
secondary air filter, 233
See also Hydrocarbon conversion (experimental)
Compression-ignition engines
combustion-generated hydrocarbons in, 88
emission characteristics of, 115
exhaust tuning of, 155
friction losses in, 59
loop scavenging in, 4, 5, 6, 24, 151
opposed-piston, 4, 7, 8
scavenging bench test results, 151–152
scavenging dynamometer test results, 153
scavenging layouts, various, 151
soot formation in, 115–116
See also Scavenging port design
Discharge coefficient, defined, 54
DKW
parallel-piston motorcycle engine, 4, 8
Duct shape. See Scavenging port design

274
Exhaust tuning  
broad range tuning, 157–159  
of compression-ignition engines, 155  
crankcase scavenging, dynamics of, 155–156  
exhaust boost ports, 164–165  
exhaust resonating volume (WOT), 164  
exhaust sonic speed vs. specific output, 156–157  
exhaust throttling  
effect on hydrocarbon emissions, 166  
exhaust throttling device, 167  
exhaust throttling valve, 165  
Piaggio variable-exhaust tests, 162–163  
sharp range tuning, 159–161

Ficht-PDS fuel injection system. See Fuel injection (high-pressure)  
Flow modeling and simulation, 25–26  
one-dimensional method  
analytical expressions for, 30–35  
discussion of, 26–28  
position characteristic, 31  
Reimann variables in, 31, 33  
schematics (tuned/untuned engines), 27  
three-dimensional method  
KIVA computer model for, 39  
Snapper piston-motion logic model, 39–40  
two-dimensional method  
experimental vs. theoretical results, 39  
mathematical model for, 35–36  
three-zone model: cylinder domains, 36–37  
three-zone model: scavenging stream shape, 38  
three-zone model: theoretical results, 37

Four-stroke engines  
applications of, 12  
catalytic converters on, 221

friction losses in, 60–62, 63, 65  
smog formation in, 111–112

Friction losses, 59  
from direct motoring tests, 62, 64–65  
estimation from IMEP, 62  
v.s. load (two-stroke, four-stroke), 60–62, 63, 65  
Willans line, estimation from, 62, 63

Fuel consumption  
Ficht-PDS fuel injection system, 180  
IAPAC Cosa 125 with exhaust throttle, 192, 194  
IAPAC Cosa 125 without exhaust throttle, 192, 193  
importance of in future engines, 263–264

Dr. Marco Nuti has almost thirty years of experience in research and development of engines. He was born in Pisa, Italy, on June 17, 1944, and received his doctorate degree “Laurea” in Mechanical Engineering from the Pisa Technical University in 1968.

In 1969, Dr. Nuti joined Piaggio in its R&D department. There he has been involved in the full range of engine research and development, including CAD, FEM/FEA, CFD, computer modeling, materials, components, and manufacturing technologies. He currently is in charge of Technical Innovation at Piaggio.

Dr. Nuti has written more than 50 technical publications relating to innovative solutions on vehicle and engine design. He is a member of the Society of Automotive Engineers and serves as chairman of a research company, S&R Sud. Dr. Nuti also serves as director of Consorzio Pisa Richerche and director of Consorzio Richerche Benevento. He taught specialized fluid machines at Pisa Technical University.
