Index

Abe, M., 385-386
Allison, J.A., 237-238
Aluminum/aluminum alloys
  biaxial Mode I crack growth (types 2024, 7075), 237-238
  Mode II growth rates (7075-T6), 244-245
  nonproportional hardening factors (type 6061), 290, 292
Anticlastic bending
  in multiaxial testing, 107-109
Applications, multiaxial fatigue theory
  introduction to, 411-412
  automobile crankshaft, high-cycle fatigue of, 427-432
  handlebar system, bicycle, 432-438
  heavy-duty axle housing, 438-444
  summary discussion of, 444-445
  See also Multiaxial loading
\sqrt{Area}
  distribution of pore size in flawed cast drum, 403-405
  and fatigue limit stress (tension/torsion), 407
  as measure of flaw size, 380-384
ASME Boiler and Pressure Vessel Code
  numerical example, typical, 312
  problems with ASME methodology, 313
  strain-based method, strain components in, 311-312
  stress-based method, computational steps in, 310-311
  stress-strain range extremes, use of, 312
Automobile crankshaft, fatigue assessment of, 427-430
Awaji, H., 122
Axial fatigue See Fatigue
Axle housing, heavy-duty, 438-444
Multiaxial Fatigue

Bannantine, J.A., 58
  cycle counting and strain range identification, 315
  failure planes (variable amplitude multiaxial loading), 303-304
  load history (variable amplitude multiaxial loading), 301-303
  tensile and shear hysteresis loops (nonproportional multiaxial loading), 301-303

Barkey, M.E., 372-375

Barthelemy, B.M., 252, 253, 270

Bending
  anticlastic (in multiaxial testing), 107-109
  bending moments (notched shafts, nonproportional loading), 352-354
  fatigue in combined torsion-bending stress (Gough), 129-131, 132-134
  fatigue in combined torsion-bending stress (Sines), 134-138
  fatigue strength ratios (bending to torsion), 133
  mean bending stress vs. hydrostatic/normal stress (Sines), 150
  mean stress in cyclic torsion with static bending (shaft), 419-421
  multiaxial pressure with cyclic bending (pipe), 420-421
  notched shafts in combined tension/bending (Gough), 356-357
  reverse bending fatigue and static torsion, 135-136
  stress concentrations in bending, torsion (notched shafts), 342-343, 344
See also High-cycle fatigue models; Testing, multiaxial

Bentham, J.P., 257

Biaxial loading
  biaxial strain ratio vs. fatigue life (shear damage parameter), 418
  biaxial strain ratio vs. fatigue life (SWT damage parameter), 416-417
  biaxial tensile loading, proportionality of, 280-281
  equi-biaxial tension loading, stress/strain relationships for, 15-16
  Mohr’s circle representation of, 15
  stress/strain response (fixed principal axes), 421, 422
  tensile crack loading, stress field for, 233-235
  in tension/tension-torsion, 277-288
See also Biaxial strain ratio; Multiaxial loading

Biaxial strain ratio
  causing errors in visualizing nonproportionality, 423
  vs. fatigue life (shear damage parameter), 418
  vs. fatigue life (SWT damage parameter), 416-417

Biaxial stress factor
  and cracks emanating from a hole, 379-380

Biaxial stress ratio
  elastic shear stress contours (plastic zone size, Mode I), 235
  in-plane biaxial crack loading (Mode I, Mode II, and mixed-mode), 233-235
  Mode I crack growth (Brown-Miller), 235, 237
  stress, strain concentration factors as functions of, 425-426
Boehler, J.P., 113
Bonnen, J.F., 195-196, 201, 228-229
Brose, W.R., 361-364
Brown, M.W.
   biaxial stress and Mode I crack growth, 237
   Case A/Case B fatigue cracks, 183-184
   constant life curves (on \( \Gamma \) plane), 182-183
   critical plane model, 182-186, 317-318, 330-333
   cycle counting and relative equivalent strain, 304-310
   damage parameters/fatigue life (four strain paths), 333
   low-cycle fatigue models, 182-186, 199
   nonproportionality rotation factor (F), 288-289
   normal strain coefficient (S), 184-186, 199, 201, 210-211
   normal strain vs. fatigue life (critical plane model), 182, 199
   stress ratio and mixed-mode loading thresholds (316 stainless), 247-248
   stress-based model, summary of (Case A cracks), 227
Buczynski, A., 368-370

Cailletaud, G.
   damage in multiaxial low-cycle fatigue, 323
   multiaxial damage model D(\( \theta \)), 324-325
Case A/Case B fatigue cracks
   aspect ratios of, 98
   Brown-Miller analysis of, 183-184, 227
   growth of, 82
   See also Crack nucleation/growth
Casting flaws, notched drum, 403-405
Chambers, A.C., 123
Chu, C.-C.
   anisotropic hardening model, 58
   critical plane model (maximum damage parameter), 317-318
   fatigue damage assessment (critical plane parameters), 316
   fatigue life using maximum stress, 223, 224
   multiaxial stress-strain model (fatigue life), 195-196, 201, 228-229
   Neuber’s rule approximate solution, 370-372
Coffin and Manson
   plastic strain vs. fatigue life, low-cycle, 171
Complementary strain energy, 43
Compression loading
   cyclic torsion with static tension/compression, 136-137
Compression loading (continued)
  static, effect on material failure in shear/tension, 205, 206, 208
  static compression with static hoop tension, 207
Conle, F.A., 195-196, 201, 228-229
Constant life curves
  on Γ plane (Brown-Miller), 182-183
Contact stress
  discussion and examples of, 412-414
Coordinate systems
  principal stresses/principal axes, 8-9
  three-dimensional stress, 6-7, 31-32
  two-dimensional stress, 3-4
Crack closure
  cyclic plastic zone, 84
  loading/unloading, stress fields in, 84
  mean stress, effect of (Mode I and Mode II loading), 203-204
  mechanisms of, 86
  in Mode II loading, 90
  monotonic plastic zone, 84
  oxide-induced closure, 86
  plasticity-induced closure, 86
  residual compressive stresses in, 85, 86
  roughness-induced closure, 86
  in test specimen (Sehitoglu), 85
See also Crack nucleation/growth
Crack nucleation/growth
  aluminum, small crack growth in, 88, 89
  √area as measure of flaw size, 380-385
  Case A/Case B fatigue cracks (Brown-Miller), 183-184
  in case-hardened shafts, 412, 413
  crack alignment (biaxial loading, Mode I, Mode II), 235
  crack face rubbing (Mode II growth), 90
  crack growth analysis, notched shaft (tension-torsion loading), 397-402, 403
  crack growth direction (mixed-mode loading), 245-246
  crack growth modes (mixed-mode loading), 246-247
  crack orientation at 25% and 90% of fatigue life (1045 steel), 323-324
  crack sliding mechanisms, friction/rubbing in, 240-241
  cracking behavior (1045 steel), 94-97
  cracks emanating from a hole, 379-380
  critical resolved shear stress, plastic deformation at, 79
  and cyclic plasticity energy analysis (Morrow, Feltner, Halford), 174-176
  and fatigue model selection, 411-412
Crack nucleation/growth (continued)
growth processes, Stage I and Stage II, 81-82, 98
growth rate and crack length (Mode III), 244
growth rate models, mixed-mode: equivalent strain intensity models, 252-255
growth rate models, mixed-mode: strain energy density models, 250-252
growth rate models, mixed-mode: stress intensity models, 249-250
growth rates, Mode II (SNCM 8 steel, 7075-T6 aluminum), 244-245
growth rates in torsion, 241-245
growth thresholds, typical data for, 88, 90
growth/closure: small vs. long cracks, 87-88, 90
inclusions, stress concentration at, 80
influence of mean stress on, 187-188
in-plane shear loads (torsion, Mode II), 80-81
J-integral analysis of, 255-256
large cracks—growth in tension, 416
load history, effect of (Socie-Shield), 187-188
Mode I growth (biaxial loading), 236-238
Mode I microcrack growth (SWT model), 200
Mode I vs. Mode II crack growth, 269
in notched drum with casting flaws, 403-405
opening loads (tension, Mode I), 80-81
out-of-plane shear loads (torsion, Mode III), 80-81
perpendicularity to applied stress, 83
in polycrystalline metals, 79
residual stresses, effect of, 84
saddle joint analysis, 262-265
shear band model, 83
shear crack growth rate (mixed-mode, 1045 steel), 253-254
shear cracks, Case A/Case B, 82, 98
shear mechanisms—Mode II growth, 90-91
short cracks, propagation of, 265-267
slip band formation (extrusion/intrusion), 79-80
slip bands, nucleation of, 78-79
small cracks, nucleation and growth of, 87-90, 98
strain energy density factor and angled crack growth, 250-252, 253, 270
stress intensity factors, surface crack analyses using, 258-262
summary discussion of, 98
surface striations, formation of, 83-84
tensile mechanisms—Mode I growth, 82-84
in tension/torsion overload, 241-243
in torsion, example of (at 20% of fatigue life), 385-386
in torsion loading (notched shaft), 357-358
Crack nucleation/growth (continued)
in torsion (thumbnail crack, Mode II and Mode III growth), 238
See also Crack closure; Critical plane models; Damage maps; Failure; Fatigue; Fractures

Crack tip displacement
  equivalent stress intensity (Tanaka), 249, 270-271
  in saddle joint analysis, 263

Critical plane models
  introduction to, 181
  critical plane, defined, 138
  critical plane, Findley analyses of, 138-141
  critical plane damage parameters (typical), 24
  critical plane definition *vis-à-vis* maximum damage, 316-317
  growth of Mode I microcracks in (SWT model), 200
  maximum damage parameter (various models), 317-318, 330-333
  mean stress analysis (Fatemi-Socie), 186-190, 199-200
  mean stress effects, modeling of, 202-209
  normal strain *vs.* fatigue life (Brown-Miller), 182, 199
  SWT parameter for (Smith-Watson-Topper), 189-190
See also Critical plane/energy models (combined); Damage models; Energy models

Critical plane/energy models (combined)
  elastic/plastic strain energies (Liu), 192
  multiaxial stress-strain model (Chu, Conle, Bonnen), 195-196, 201
  strain intensity factors (Mode I, Mode II), 190-191
See also Critical plane models; Damage models; Energy models

Cycle counting
  in critical plane damage models, 335
  cycle identification (Wang-Brown), 315
  and relative equivalent strain (nonproportional loading, Wang-Brown), 304-310
  and shear strain (proportional loading, 30° plane), 314
  strain ranges identified by (Wang-Brown, Bannantine-Socie), 315

Cyclic deformation
  introduction to, 44
  cyclical creep (ratcheting), 48-49
  cyclical stability, materials reaching, 48
  isotropic hardening in, 45-46, 48
  kinematic hardening in, 46-48
  major components of, 73-74
  mean stress relaxation in, 49-50
  model for, 73
  nonproportional cyclic hardening, 50-53
  proportional/nonproportional loading in, 73
Cyclic deformation (continued)
See also Fatigue; Hardening; Plastic deformation/plasticity
Cyclic strength coefficient (K), 52-53, 293

Damage, fatigue See Applications, multiaxial fatigue theory; Crack nucleation/growth;
Critical plane models; Damage maps; Damage models; Fatigue; Fatigue life;
High-cycle fatigue models

Damage maps
introduction to, 92, 98
AISI 304 stainless steel, 92-94
crack growth modes (mixed-mode loading), 246-247
cracking behavior, categories of, 92
failure mechanisms, 97
Inconel 718, 94, 95
long lives, crack nucleation in, 97
microcracks, linking of, 97
SAE 1045 steel, 94-97
See also Damage models

Damage models
Brown-Miller (See Brown, M.W.)
critical plane, cycle counting in, 335
cyclic plasticity, typical parameters compared, 198
damage accumulation model (1045 steel), 321-323
damage parameters, calculation of (four strain paths), 330-333
Dang Van (See Dang Van, K.)
effective stress/strain models and nonproportional loading, 335
Fatemi-Socie (See Fatemi, A.; Socie, D.F.)
fatigue damage distribution (in-phase/out-of-phase, 1045 steel), 316-317
formulation in terms of maximum damage plane, 335
maximum damage models, various (nonproportional loading), 330
multiaxial damage model (Robillard-Cailletaud), 323-325
in proportional vs. nonproportional loading (discussion), 316
Smith-Watson-Topper (See Smith, R.N.)
strain-based, summary of, 226-229
See also Critical plane models; Critical plane/energy models (combined); Damage
maps; Energy models; Fatigue; Variable amplitude multiaxial loading

Dang Van, K.
elastic shakedown under multiaxial loading, 144-145
fatigue limit criteria, Papadopoulos modification to, 298-299
fatigue limit criterion (critical volume microstress), 143, 145-146

453
Dang Van, K. (continued)
High-cycle fatigue model microstress criterion, 143-146, 158-161
macroscopic/microscopic scales, 143-144
nonproportional loading, shaft numerical examples, 164-166
nonproportional loading and Dang Van criteria, 297-298
proportional loading damage criterion (fuel injector numerical example), 158-161
shear and hydrostatic stresses, importance of, 299
Tresca criterion and microscopic shear stress (Dang Van), 145
Davis, D.C., 107
de Villiers, J.W.R., 111
Deformation, axial
with applied torsional loading, 56
Deformation, plastic See Plastic deformation
Demmerle, S., 113
Deviatoric (π) plane, 41-42
Deviatoric stress, 20-21
Distortion criterion (von Mises) See von Mises distortion energy criterion
Dittmer, D.F., 237-238
Dowling, N.E., 361-364
Downing, S.D, 103
Drucker, D.C.
normality postulate, 54
Ductility
axial fatigue ductility/shear fatigue ductility, 172
Iosipescu specimen (ductile shear test), 123

Effective strain
in energy and critical plane models, 198-201
Eftis, J., 235-236
Elastic shakedown (Dang Van), 144-145
Elasticity
complementary strain energy, 43
elasticity tensor, 39-40
plastic work, defining expression for, 43
strain energy, 42-43
stress/elastic strain relationships, 37
stress/strain elasticity matrix, 35-37
Yield surfaces (octahedral π-plane), 42-43
Yield surfaces (plane stress), 40-41
See also Cyclic deformation
Ellyin, F.
  elastic work and fatigue life, 217-218
  elastic work model, summary of, 227
Ellyin model, nondirectionality of, 204
plastic/elastic strain analysis, 178-181
triaxiality factor, 199
Endo, T.
damage accumulation model (nonproportional loading, 1045 steel), 322-323
effects of small defects on fatigue strength, 380-385
Energy models
effective strain in, 198-201
Morrow cyclic plasticity analysis, 173-176
plastic work per cycle/accumulated plastic work (Garud), 176-178
plastic/elastic strain analysis (Ellyin), 178-181
See also Critical plane models; Critical plane/energy models (combined); Damage models
Equivalent strain
  1% equivalent strain and hollow cylinder yield (tension/torsion/combined), 70-72
correlation with tension/torsion tests (Yokobori), 172, 173
equivalent strain intensity and crack growth, 252-254, 267-268
equivalent strain models, basics of, 226-227
  relative, and cycle counting (nonproportional loading, Wang-Brown), 304-310
Equivalent stress intensity, basis for
  crack tip displacement (Tanaka), 249, 270-271
  strain energy density (Sih), 271
  strain energy release rate, 271
Ewing, J.A., 77-78
Extensometers See Testing, multiaxial

Failure
  in carburized/case hardened shafts, 412, 413
  failure criterion (Ellyin plastic/elastic strain analysis), 179-181
  failure mechanisms (damage maps), 92-97
  failure planes (variable amplitude multiaxial loading), 303-304
  notched shaft fracture surfaces (torsion tests), 359
  octahedral strain vs. cycles to failure, 173
  under pressure loading, 413, 414
  shear failure in torsion loading (static mean stresses) (Inconel 718), 207-208
  static compression loading and material failure in shear/tension, 205, 206, 208
Multiaxial Fatigue

Failure (continued)
torsion, failure modes in, 238-241
See also Crack nucleation/growth; Fatigue

Fatemi, A.
critical plane fracture analysis, 186-189, 199-200
critical plane model, 186-189, 319-320, 330-333
damage parameters/fatigue life (four strain paths), 333
fatigue life (combined tension/torsion), 219-220
friction/rubbing and fatigue life, 186
maximum damage parameter (critical plane model), 319
mean stress modification to critical plane analysis, 202, 228
sensitivity factor (k), 188, 212, 213
shear crack growth (multiaxial fatigue), 253

Fatigue
axial fatigue strength and static tensile/compressive stress, 135
axial/shear fatigue ductility, 172
calculated vs. experimental $K_f$ (Nisitani-Kawano), 357-358
combined bending/torsion stress (Gough), 129-131, 132-134
combined bending/torsion stress (Sines), 134-138
cyclic torsion with static tension, compression, 136-137
damage parameters, critical plane, 24
effects of small defects on fatigue strength (Murakami), 380-385
fatigue analysis, complexity of, 444
fatigue ductility coefficient, exponent, 188, 189
fatigue strength coefficient, exponent, 188, 189
fatigue strength ratios (bending to torsion), 133
Findley empirical constant k, determining/typical values, 140
McDiarmid shear-stress amplitude criterion, 142
Morrow cyclic plasticity analysis (energy model), 173-176
multiaxial, uniaxial hysteresis loop energy in (Garud), 176-178
multiaxial analysis methods, summary discussion of, 444-445
multiaxial low-cycle fatigue, damage from (Robillard-Cailletaud), 323
octahedral shear stress as fatigue criterion (Sines), 134-138
Papadopoulos modification to Dang Van criteria, 298-299
plastic/elastic strain analysis (Ellyin), 178-181
reverse bending fatigue, effect of static torsion, 135-136
Sines criterion for alternating tension/torsion, 137-138
static yield criteria, 171-173
test data, HSLA steel (strain-controlled tension, torsion), 209-210, 266
torsional fatigue strength, effect of static torsion, 135, 136
uniaxial to multiaxial, dangers in extrapolating, 21, 24
See also Cyclic deformation; Fatigue life; Hardening; High-cycle fatigue models
Fatigue damage models See Critical plane models; Critical plane/energy models (combined); Damage models; Energy models

Fatigue life

actual vs. predicted (HSLA steel), 209-210, 266
automobile crankshaft, fatigue assessment of, 427-432
calculated fatigue lives, summary of (various models), 225-226, 320
in combined tension/torsion (Fatemi-Socie), 219-220
dependence on stress concentration factor, 406
effect of nonproportional hardening on, 292-293
experimental, four strain paths (various models), 333
experimental vs. theoretical (1045 steel, Inconel 718), 255-256
handlebar system, prediction for, 436-438
hydrostatic stress in estimation of, 20

life fraction \( \frac{N}{N_f} \), 92, 93, 95, 96

and maximum (35° angle) strain range (Brown-Miller), 218-219
for nonproportional load histories (various), 282-284
with normal stress, maximum strain (SWT), 220-221
and plastic work (Garud), 176-178, 216-217
and positive elastic work (Ellyin), 217-218

Steel/steel alloys
0.4% carbon steel: macroscopic fracture mechanism, 239
304 stainless: cracking behavior, 92-94
304 stainless: damage parameters, experimental fatigue life, 333
304 stainless: hysteresis loops (proportional/nonproportional loading), 285-287
304 stainless: normal strain effects coefficient (S), 185
304 stainless: tubular specimen stress-strain histories, 325-329
316 stainless: biaxial stress and Mode I crack growth, 237
316 stainless: stress ratio and mixed-mode loading thresholds, 247-248
1035 steel: cycles to failure (octahedral shear strain), 172, 173
1045 steel: crack orientation at 25% and 90% of fatigue life, 323-324
1045 steel: cracking behavior, 94-97
1045 steel: damage accumulation model (nonproportional loading), 322-323
1045 steel: fatigue damage distribution, in-phase, out-of-phase, 316-317
1045 steel: fatigue life, experimental vs. theoretical, 255-256
1045 steel: shear failure with torsion, static mean stress, 207-208
1045 steel: tension loading of notched shaft, 390-392
4340 steel: Mode I and Mode III growth rates, 242-244
Cr-Mo-V: fatigue damage distribution, 316-317
Cr-Mo-V: normal strain effects coefficient (S), 185

473
Multiaxial Fatigue

Steel/steel alloys (continued)

En15R steel (0.4% C): normal strain effects coefficient (S), 185
HSLA steel: axial fatigue test data, 209-210, 266
HSLA steel: material properties, 209-210
Inconel 718: cracking behavior, 94, 95, 187-188
Inconel 718: fatigue life, experimental vs. theoretical, 255-256
Inconel 718: shear failure with torsion/static mean stress, 207-208
low-carbon steel: crack growth modes in mixed-mode loading, 246-247
low-carbon steel: mean stress tests (El-Magd-Mielke), 150-151
shear crack growth rate (mixed-mode, 1045 steel), 253-254
SNCM 8 steel: Mode II growth rates, 244-245
stainless steels, cyclic hardening of, 421-422

Stiffness tensor, 39, 40

Strain

1% equivalent strain and hollow cylinder yield (tension/torsion/combined), 70-72
complementary strain energy, 43
cycle counting and relative equivalent strain (Wang-Brown), 304-310
cyclic stress/strain curve (proportional/nonproportional loading), 50-51
distribution of (vs. inclination of plane), 11
effective, in energy and critical plane models, 198-201
effective octahedral, defining expressions for, 18, 32-33
effective octahedral, Tresca criterion for, 19-20, 33
elastic/plastic strain energies (Liu), 192
multiaxial stressed notches, strain-based approaches to (summary), 406-407
nonproportional, additional cyclic hardening from, 334
normal strain coefficient (Brown-Miller), 184-186, 199, 201, 210-211
plane, two-dimensional equivalent for, 16-17
principal strain, calculation of, 9
Ramberg-Osgood stress/strain curve, 56
shear strain vs. shear stress, 7-8, 32
strain concentration factors (stepped shaft), 344-345
strain intensity factors (Mode I, Mode II), 190-191
strain range identification and cycle counting, 315
strain range vs. strain plane angle, 218-219

Darrell F. Socie is Professor of Mechanical Engineering at the University of Illinois at Urbana–Champaign. He worked as a consulting engineer for Structural Dynamics Research Corporation prior to joining the University of Illinois in 1978 and has remained active in industrial consulting on fatigue- and fracture-related problems. In 1982, Dr. Socie founded SoMat Corporation, a manufacturer of Data Acquisition Systems and Data Analysis Software.

Dr. Socie earned his B.S. and M.S. in Metallurgical Engineering from the University of Cincinnati. In 1977, he earned his Ph.D. in Theoretical and Applied Mechanics from the University of Illinois at Urbana–Champaign. His early research work at the University of Illinois involved the development of fatigue life estimation models for notched and cracked members subjected to variable amplitude loading. Dr. Socie was responsible for the development of ASTM Standard E-1049 Cycle Counting in Fatigue Analysis. This was followed by ten years of studying cyclic deformation of and fatigue of metals under multiaxial states of stress. Dr. Socie’s current research includes cyclic deformation and fatigue of ceramic materials at high temperatures, durability assessment of porous materials, and probabilistic fatigue and fracture design.

Dr. Socie has received numerous professional awards, including the ASTM Fatigue Achievement Award in 1992, the Society of Automotive Engineers Arch T. Colwell Award in 1996, and a Japan Society for the Promotion of Science
Since 1988, Gary B. Marquis has worked at the Technical Research Center of Finland, VTT Manufacturing Technology, where he is a senior research engineer in charge of experimental and analytical fatigue research. He is an active fatigue and durability consultant to many industries and institutes, and he has been involved in numerous international research projects on fatigue of on- and off-road vehicles, ocean-going ships, and energy production equipment. Dr. Marquis' current research interests include high-cycle variable amplitude and multiaxial fatigue, durability assessment of welded structures, and fatigue in high-temperature and aggressive environments.

Dr. Marquis received a B.S. in General Engineering and an M.S. in Mechanical Engineering from the University of Illinois at Urbana–Champaign. In 1995, he earned his Doctor of Technology Degree in Mechanical Engineering from the Helsinki University of Technology. Dr. Marquis has served as chairman for three international symposia on fatigue design and is a member of the European Structural Integrity Society.
