NOTE: Page numbers followed by ‘f’ and ‘t’ refer to figures and tables respectively.

2-Ethylhexanoic (2-EHA) acids, 107
2015 Toyota Prius, 63

A
AA batteries, 78
AAA batteries, 78
Absorbent (absorptive) glass mat (AGM), 18, 24–26, 25f
batteries, 39
AC electrical fire, 64
AC electricity, 63
AC evaporator, 167
Advanced lead-acid battery designs, 27–28
Aftermarket accessory fire, 191f, 192f, 193, 193f
Aftermarket alarm fire, 194, 196f, 197f
Agastya Samhita, 3
AISI 6160, 157
Alternator(s)
generators and, 57–61
intact after house fire, 60f
melted, housing, 59f
mount bracket, 58
Amalgamation, 5
American wire gauge (AWG–SAE) size, 39
Ammonium chloride, 7
Ampere, 9, 10, 12
Ampere-Hour, 62
Anode/negative electrode, 17
Arc bead, 144
Arcing B+ cable, 48
Area of Origin, 85, 103, 105, 158f, 161, 172
Armrest combination switch, 204f
Atraverda battery, 28
Atraverda Bipolar, 28
Auto ignition, 64, 65, 106, 107
Automotive electrical fire science, 97
electrical fire analysis, 109–112
fire analysis of vehicle, 101–102
compartmentalization, 102–105
engine compartment, 106–108
FMVSS 302, interior flammability, 99
SAE J369, 100
SAE J1344, 100–101
safety, 97–98
signs of electrical heat, 112–113
aftermarket accessories, 189–199
battery explosion caused by
outside influence, 121–127
battery plates, 113–116
copper chloride, formation,
181–186
cratering on connectors, 176–181
discoloration, bundle
de-stranding, and fraying of
cables, 127–144
electrical circuit shorting into
another circuit, 163–173
electrical heat on fusible links,
173–176
failure of electromechanical
device, 199–207
heavy-duty applications, 144–163
no Large-Order Fire Event, 186–189
shrunken or exploded remnants of battery lugs, 116–121
Axion Power E3 Supercell®, 28

B
“Bad contact” issues, 44
Baghdad Batteries, 1, 2f
Barium sulfate, 20
Battery(ies)
  B+ cable, 115
defined, 3
explosion caused by outside influence, 121–127
history, 1–8
on/off switches, 147f
tender, 71
B+ cable, 40, 51, 115, 122f
at battery box, 160f, 161f
resting on AC pipe, 48f
routing to PDM, 47f
Bendix Corporation, 37
Bendix® starter drive, 37
B+ junction box, 159f
Blown fuse, 175f, 176
Boom box, 189, 192
  fire, 190f
Brake fluid, 106
Brine, 3
Brine beneath salt lakes, 75
British Thermal Unit (BTU), 39, 99, 109
Bromine chloride, 77
Brown, Joe, 10–11
Bundle de-stranding, 127–144
Burn pattern
  on inside of truck, 200f, 201f, 202f
  on wall of electrical box, 153f, 154f
Burn Rate, 100, 105

C
Cable clamps, battery, 121
Camaro model, 40
Camaro trunk, 40
Carbon brushes, 57
Carbon-pile battery load, 176
Cargo box, 148
Casing design considerations for forklifts and heavy equipment, 29–31
Cathode/positive electrode, 17
Cause and origin, 39, 102
Charge-depletion, 94
Charge-sustained modes, 94, 95
Charging of lead-acid battery, 68–73
Chemistry of lead-acid plate design, 31–35
Chinese super-capacitor electric bus, 84, 84f
Chloride Accumulator Battery, 12
Circuit failure, 64
Circuit over-current protective devices, 40
Claw-pole alternators, 57
Cold cranking amps, 62
Combat battery degradation, 38
Combustibility resistance standards, 98
Combustible, 39, 88, 102, 108

Greg Barnett is an automotive engineer and technical expert, with a career spanning over 45 years in the automotive, heavy truck, and equipment industry. He was last employed by Land Rover of North America as a field service engineer and instructor of automotive technology. He achieved the level of factory Certified Master and accredited instructor.

Currently, he works as a consultant assisting attorneys, insurance carriers, and automobile manufacturers on legal actions that require technical expertise. His casework revolves around large losses caused by vehicle fire, product failure, product refinement, professional negligence, personal injury, vehicle arson, and fraud. Mr. Barnett is a four-level Certified Master by the National Institute for Automotive Service Excellence (ASE) and was listed in the Automotive Hall of Fame as a World Class Technician in 1994.

The author began collecting data on vehicle fires starting in the early 1990s. His experience with actual vehicle fires began in the 1970s. As vehicle plastics evolved into modern polymeric, Mr. Barnett began documenting the lack of combustibility of the materials selected by manufacturers in various fire cases. Identifying and understanding the combustibility of compounded polymeric and nanocomposites is critical to any vehicle fire investigation. These observations and the data collected on vehicle fire analysis became the subject of his Master’s thesis and eventually morphed into his first book, *Automotive Fire Analysis: An Engineering Approach*, published in 2003.
